***Hilara maura* (L.) (Dip.: Empididae) feeding on *Nematopogon swammerdamella* (L.) (Lep.: Incurvariidae)**

On 11 June 1995, in a “set-aside” field at Grenzhof, near Heidelberg, Baden, Germany I watched at close quarters a male *Hilara maura* copulating with a female which was absorbed in feeding on a silk-wrapped male of *Nematopogon swammerdamella*, a fairly numerous species in the adjacent woodlands. The very long whitish antenna of the moth protruded from the silk - an altogether curious sight.— JOHN F. BURTON, In der Etzweise 2, D-69181 Leimen-St Ilgen, bei Heidelberg, Germany.
